Security incident report

Section 1: Identify the network protocol involved in the incident
The internet protocol is used since the source and destination IP/port are identified The protocol involved was HTTP since the issue was accessing the web server

Section 2: Document the incident
The incident occurred when multiple customers emailed yummyrecipe's helpdesk stating that the website prompted them to download a file to access free recipes. When customers downloaded the file, they were directed to a fake website containing the malware which slowed their computers down. The owner tried to login to the admin channel but a password change was made which prevented them from accessing it. When the team ran tcpdump and checked for the logs, the first thing was the machine IP requesting access from the DNS server to access the website with the destination IP 203.0.113.22 at time 2:18 pm. The next section was the source computer sending a connection request (flag S) from the destination which took around 2 mins. Then a log entry with the code `HTTP: GET / HTTP/1.1 appeared which could be a request to download the malicious code.` Then a sudden change of traffic occurred where it was routed from the source IP to a destination IP with domain name greatrecipesforme.com with a new IP address 192.0.2.172

Section 3: Recommend one remediation for brute force attacks
Users should use strong passwords that contain a mix of letters, numbers and characters to lower the chance of a dictionary brute force attack with the use of weak known passwords.
