

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	Recently the organization experienced a DoS attack which led to the internal network to stop working for 2 hours. During this time the network services stopped working due to an incoming flood of ICMP packets. The team believes that a malicious actor flooded the network to stop it from operating normally and preventing users from accessing the services.
Identify	The company's security team investigated the event and found out that a malicious actor has sent a flood of ICMP packets into the company's network through an unconfigured firewall
Protect	The team implemented new firewall rules in which it limited the rate of incoming ICMP packets. New source IP addresses verifications have been placed to check for spoofed IP addresses.
Detect	Network monitoring software IDS/IPS have been placed to filter out suspicious ICMP packets and detect abnormal traffic patterns
Respond	The team has set a plan to limit the number of ports available to access the network and detect if an IP address or an ICMP packet enters the network many times then it will be blocked.
Recover	If any information is lost then the team will use the latest data backup to restore

	the missing data and all users should re-enter their information from the last backup

---
